

NOPEEK

One secret. Nobody gets to peek.

A multiplayer browser game with a secret generated and checked inside confidential computation.

Hidden games need a secret keeper

A conventional puzzle server knows the answer.
Players trust its operator to hide it and apply the rules.

NOPEEK puts the secret inside encrypted computation.
The published game program applies the same rules to every player.

Five symbols. Ten attempts. One winner.

Create a room. Share a link.
Race with up to four friends.

Each clue counts correct positions
and symbols that belong elsewhere.

Browser player keys sign actions.
The app sponsors network fees.

**The secret has no
readable copy on
our server**

Arcium creates the code in MPC and returns ciphertext.

Each guess reveals only two counts.
Even the host has to solve it.

Anyone can inspect the room account.

Solana is the game's referee

The program locks the player roster when the race starts.
It enforces ten attempts per player and one pending guess at a time.
It accepts verified Arcium callbacks and records the first correct result.

A database can store scores. This integration makes the rules and encrypted game state inspectable without giving our server the code.

First users and growth

Start with WHU participants and student groups who play browser games.
One host can bring three friends through an invitation link.

Validate comprehension, completed rounds and requests to play again.
No traction or retention figures are claimed before observing users.

Potential revenue: themed room packs and event hosting.
Compute latency and sponsored costs need measurement.

A complete prototype, with clear limits

Working loop: room → players → guesses → clues → winner.
Mobile layout, keyboard controls and stalled-attempt recovery.
Local practice teaches the rules with its privacy limit clearly disclosed.

Prototype assumptions: Arcium cluster confidentiality; retained program upgrade authority; public clues; browser identity stored on the device.

Next: external security review, latency testing and identity recovery.

NOPEEK

Play it. Inspect it. Try to beat it.

Demo: nopeek-whu.vercel.app

Pitch: nopeek-whu.vercel.app/pitch

Source: github.com/rmazz05/nopeek

Open two browsers, join one room and start the race.

Inspect the ciphertext, submit a guess and follow the verified clues.

One secret. The host has to solve it too.
